

InterBond

1 Polymer tip. The sharp point of the InterBond's set-in polymer tip improves ballistic performance and makes for a flat trajectory. Lead tips cannot be formed so accurately.

2 The lead core is bonded to the jacket and will not separate from it even at high target velocities. Thanks to the bonding process, high weight retention and thus deep penetration is achieved.

3 The Expansion Control Ring stops expansion and helps produce the perfect mushroom shape of the fired bullet. The InterBond retains more than 90% of its mass.

4 The red brass jacket is very thick and tough at the base in order to make sure that the bullet holds together. Thus, weight is reliably retained even through large bones.
